

NEW PRODUCT NEWS

MARCH '19 | WEB VERSION

Welcome to the Future! Wireless light management has never been easier.

Based on Bluetooth® technology, Blu2Light enables convenient and simple wireless light management using an app on any smart device. The innovative Blu2Light mesh system guarantees a much extended application spectrum within the professional lighting market.

Among other things, Blu2Light is characterised by open interface technology that permits system partners to develop and retail own devices, software or cloud-based services.

Well-known systems such as DALI can also be easily integrated into the Blu2Light operating system. And a direct integration in LED drivers or LED modules is equally possible. The future requirements of luminaire manufacturers with regards to IoT are already covered by Blu2Light today – and with multi-tier system security.

[Find out more about the technology of the future!](#)

Super simple conversion of existing DALI luminaires

For already existing luminaires, you can use light controllers for luminaire installation, **Blu2Light Connect ME** (without light and motion detection) and for requirements including light and motion detection – use our **MultiSensor XS** for ceiling heights of up to 3.5 m or **MultiSensor XL** for ceiling heights of up to 12 m.

[Read more](#)

As LED drivers currently found on the market do not feature their own power supply for the DALI bus, an additional Blu2Light **Power Supply** unit or, for larger applications, an **Extender 64** will have to be installed in your luminaire.

[Extender 64](#)

DALI drivers B2L that already contain a power supply will become available in the next generation, which will remove the need for a separate power supply unit.
