Initial Setup of an Android Device for LightBox DHCP

It is possible to setup and control the system without any additional IT hardware (limited WiFi coverage may apply).
Just one Smartphone / Tablet PC is required. The following process describes the setup that is only necessary for the first use.
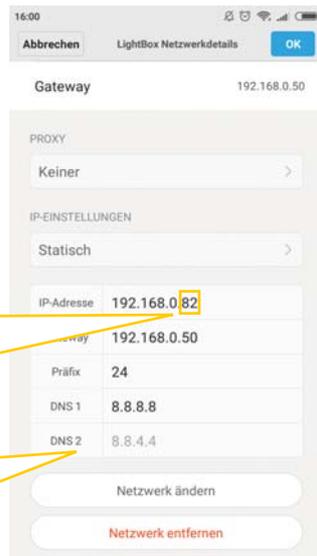

1. Search WiFi networks for "LightBox" and click on "Connect to the network".

4. The user interface can now permanently be accessed via the address http://192.168.0.81 in the Firefox or Chrome browser.

2. Change it according to the screenshot. For more users, you have to increase the highlighted number each time. Do not change the DNS 2 settings.
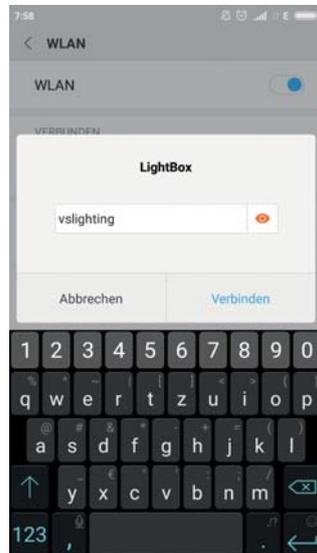

increase the high-lighted number for more users, e.g. +1

Do not change the DNS 2 settings

5. As described in Step 5 of the attached "Quick-Start-Guide LightBox DHCP", now the credentials have to be entered.

3. The password is "vslighting", then connect by "Save". The settings do not affect other network connections whereas parallel use is not recommended.

6. Finally, for inital setup it is necessary to accept the license agreement. Now the system is ready to be configured and controlled.
